### A New Era Begins: Open Access and Indexing in PubMed Central

After extensive collaboration with the U.S. National Library of Medicine (NLM), *The Primary Care Companion* is now digitally indexed and its full-text articles are available free and unrestricted through PubMed Central. Such ready accessibility of information to researchers and clinicians throughout the world greatly enhances our impact on the diagnosis and treatment of CNS disorders in the primary care setting and supports our mission to advance medical science and benefit clinical care worldwide.

PubMed Central is the premier digital counterpart to NLM's biomedical print archive. The electronic literature hosted by PubMed Central can be readily retrieved by all who search NLM through its many portals, including Entrez, Gateway, and PubMed. It is our hope and expectation that, as an open-access, indexed publication, the *Companion* will become an even more attractive and important venue for researchers and clinicians alike. Such unrestricted access assures authors that their work will be disseminated to the widest possible audience and removes barriers to scientists conducting medical research.

Joining PubMed Central places the *Companion* in the select company of approximately 150 journals—out of thousands published around the world. We are proud and pleased to partner with NLM in this significant venture and thank our editorial board and readers for their commitment to improving health care through an interdisciplinary approach to medicine and psychiatry. As the *Companion* enters its sixth year of peer-reviewed publication, we invite you to join us as we rededicate our effort to make important medical information freely and openly available for the benefit of physicians, researchers, and patients alike.
